## **Hog 1000/500 Boot ROM software**

Jands has released Boot ROM software V1.20.5 for the Hog 1000/500 consoles. This software may also be fitted to Echelon 1K consoles. This software supersedes all previous releases and includes the changes listed below.

### ***Test 10: Display DIP switch***

This test displays the current CPU DIP switch settings on the VDU. It is used to confirm the DIP switch settings when the base is closed, or to ensure the DIP switch circuitry is reading back the correct values when a fault is suspected. When run the current DIP switch is continuously displayed onto the VDU. While the test is being run there should be no flicker of any of the switch values.

### ***Test 15: Activate front panel LEDs***

This test is used to confirm the operation of all front panel LEDs. When run all front panel LEDs are turned on.

### ***Support for 37C669***

The Boot ROM now includes support for the FDC37C669 device in the position of IC48 on the CPU card. This boot ROM supports both the 37C669 and the original 37C665 ICs and may be freely fitted to all CPU cards that have 29F040 type FLASH devices fitted.
